

## Waves in plasma

linear  $\times$  nonlinear

**Linear waves** - small perturbations of a certain state of a system (stationary homogeneous or slowly varying in time and/or space)

Linear expansion of quantities

$$a = a_0 + a_1(\vec{r}, t) \quad b = b_0 + b_1(\vec{r}, t)$$

$a_0, b_0$  may be functions of  $\vec{r}, t$  in general

The products  $a_1^2, a_1 \cdot b_1, b_1^2$  are omitted (they are small of the 2<sup>nd</sup> order)

In spatially unlimited medium  $a_1 = \int a_{\vec{k}} \exp(i\vec{k}\vec{r}) d\vec{k}$  Fourier expansion

The perturbations evolve independently of each other, it is sufficient to study evolution of periodic perturbations.

We shall be often interested in eigenmodes, i.e. solutions in the form

$$a = \text{Re} \left\{ a_1 \cdot \exp \left[ i \left( \vec{k} \vec{r} - \omega t \right) \right] \right\}$$

Eigenmodes are one of the characteristics of a system. We shall search for the dispersion relation  $\omega = \omega(\vec{k})$

### **Way of the system description**

- Two-fluid hydrodynamics - simple, but in some cases incomplete description of the system
- Vlasov equation

### **Classification of waves**

- Longitudinal waves x transverse waves
- High-frequency (electron) waves x low-frequency waves
- Plasma without stationary  $B$  x plasma in magnetic field (magnetized plasma)

## Plasma waves (Langmuir waves)

*(recommended reading – Chen 4.3, 4.4, 7.4 or Nicholson 6.3-6.8, 7.3, 7.4)*

longitudinal waves - velocity  $\vec{u} \parallel \vec{k}$

high-frequency (in 1<sup>st</sup> approximation  $m_i \rightarrow \infty$ )

We assume small deviations from homogeneous stationary state

$$n_e = n_0 + n_1(\vec{r}, t) \quad \vec{u}_e = \underbrace{\vec{u}_0}_{=\vec{0}} + \vec{u}_1(\vec{r}, t) \quad n_0 = Zn_i$$

Continuity equation

$$\frac{\partial n_e}{\partial t} + \text{div}(n_e \vec{u}_e) = 0$$

$$0. \text{ order } \frac{\partial n_0}{\partial t} + \text{div}(n_0 \vec{u}_0) = 0$$

$$n_0 = \text{const.}$$

$$1. \text{ order } \frac{\partial n_1}{\partial t} + \text{div}\left(n_1 \underbrace{\vec{u}_0}_{\vec{0}} + n_0 \vec{u}_1\right) = 0$$

we omit  ~~$n_1 u_1$~~  = 2. order

$$\Rightarrow \frac{\partial n_1}{\partial t} + n_0 \text{div} \vec{u}_1 = 0$$

Electron density variations  $\rightarrow \vec{E} = 0 + \vec{E}_1(\vec{r}, t)$

$$\text{div } \vec{E} = \frac{q_e}{\epsilon_0} (n_e - Zn_i) \qquad \text{div } \vec{E}_1 = \frac{q_e}{\epsilon_0} n_1$$

Equation of motion (momentum conservation)

$$\frac{\partial \vec{u}_e}{\partial t} + (\vec{u}_e \nabla) \vec{u}_e = \frac{q_e}{m_e} \vec{E} - \frac{\nabla p_e}{m_e n_e} - \nu_{ei} (\vec{u}_e - \vec{u}_i)$$

$$\frac{\partial \vec{u}_1}{\partial t} + \nu_{ei} \cdot \vec{u}_1 = \frac{q_e}{m_e} \vec{E}_1 - \frac{\nabla p_1}{m_e n_0} \qquad (\nabla p_0 = 0)$$

Solution will be assumed in the form  $e^{i(\vec{k}\vec{r} - \omega t)}$  ( $k$  is real)

$$a(\vec{r}, t) = \text{Re} \left( A e^{i(\vec{k}\vec{r} - \omega t)} \right) = \text{Re} \left( A^* e^{-i(\vec{k}\vec{r} - \omega^* t)} \right)$$

$$a = \frac{1}{2} (A e^{i(\vec{k}\vec{r} - \omega t)} + c.c.)$$

Capital letters – complex amplitudes

Cold plasma without collisions (last term on both sides of eq. motion disappear)

$$\frac{\partial n_1}{\partial t} + n_0 \operatorname{div} \vec{u}_1 = 0$$

$$\operatorname{div} \vec{E}_1 = -\frac{e}{\epsilon_0} n_1$$

$$\frac{\partial \vec{u}_1}{\partial t} = -\frac{e}{m_e} \vec{E}_1$$

$$\vec{u}, \vec{E} \parallel \vec{k}$$

$$-i\omega N_1 + n_0 i k U_{\parallel} = 0$$

$$i k \tilde{E}_{\parallel} + \frac{e}{\epsilon_0} N_1 = 0$$

$$-i\omega U_{\parallel} + \frac{e}{m_e} \tilde{E}_{\parallel} = 0$$

$$\frac{\partial^2 n_1}{\partial t^2} + \frac{e^2 n_0}{\epsilon_0 m_e} n_1 = 0$$

$$\omega_{pe}^2 = \frac{e^2 n_0}{\epsilon_0 m_e}$$

$$U_{\parallel} = \frac{\omega}{k} \cdot \frac{N_1}{n_0}$$

$$\tilde{E}_{\parallel} = \frac{i e}{\epsilon_0 k} N_1$$

Correction when ions are taken into account

$$\omega_p^2 = \omega_{pe}^2 + \omega_{pi}^2 \quad \omega_{pi}^2 = \frac{Z e^2 n_0}{\epsilon_0 m_i}$$

Reactions on high-frequency field  $\vec{E}_1$  (it can be internal or external)

$$\vec{j}_e = -e \left( n_0 \vec{u}_1 + \underbrace{n_1 \vec{u}_0}_0 \right) = \underbrace{\frac{ie^2 n_0}{m_e \omega}}_{\sigma_E} \vec{E}_1$$

$$\varepsilon_0 \operatorname{div} \vec{E} = \rho \quad \frac{\partial \rho}{\partial t} + \operatorname{div} \vec{j} = 0 \quad \operatorname{div} \frac{\partial}{\partial t} (\varepsilon_0 \vec{E}) = -\operatorname{div} \vec{j}$$

frequency  $\omega$   $-i\omega \operatorname{div} \left( \varepsilon_0 \vec{E} + \frac{i\vec{j}}{\omega} \right) = 0$

$$\operatorname{div} \varepsilon_0 \underbrace{\left( 1 + \frac{i\sigma_E}{\omega\varepsilon_0} \right)}_{\varepsilon_r} \vec{E} = 0$$

eigenwaves of charge

$$\varepsilon_r = 1 - \frac{e^2 n_0}{\varepsilon_0 m_e \omega^2} = 1 - \frac{\omega_p^2}{\omega^2}$$

$$\varepsilon \vec{E} = 0$$

$$\vec{E} \neq 0 \Rightarrow \varepsilon_r = 0$$

and thus dispersion relation  $\omega = \omega_p$  independent of  $k \Rightarrow$  plasma oscillations

## Impact of collisions

$$\frac{\partial \vec{u}_1}{\partial t} + \nu_{ei} \cdot \vec{u}_1 = -\frac{e}{m_e} \vec{E}_1 \quad \frac{\partial^2 n_1}{\partial t^2} + \nu_{ei} \cdot \frac{\partial n_1}{\partial t} + \omega_p^2 n_1 = 0$$

solution  $\sim e^{-i\omega t}$   $\omega_{1,2} = -i\frac{\nu_{ei}}{2} \pm \sqrt{\omega_p^2 - \frac{\nu_{ei}^2}{4}}$   $n_1 = n_{10} e^{-i\omega_p t} e^{-\frac{\nu_{ei}}{2} t}$  damped oscil.

## Impact of pressure (non-zero temperature)

when  $T = 0$   $\vec{v}_g = \frac{d\omega}{d\vec{k}} = \vec{0}$  but when  $T \neq 0$  perturbations propagate

spatial shape of the perturbation is preserved, we choose  $\vec{k} = k \hat{x} \Rightarrow \vec{u}_1 = u_1 \hat{x}$

$$\frac{\partial u_1}{\partial t} = -\frac{e}{m_e} E_1 - \frac{1}{m_e n_0} \underbrace{\frac{\partial}{\partial r_j} P_{1xj}}_{\frac{\partial}{\partial x} P_{1xx}} \quad \text{adiabatic process, } \omega > \nu_{ei} \Rightarrow \text{collisions are not able to make the distribution function isotropic}$$

Unperturbed pressure  $p_0 = n_0 k_B T_0$  (scalar,  $T_0$  electron temperature)

Pressure perturbation across wavevector is caused only by density perturbation

$$P_{1yy} = P_{1zz} = n_1 k_B T_0 \quad (T_{1\perp} = 0)$$

In longitudinal direction, the work by pressure must transform into thermal energy

$$\underbrace{\frac{1}{2} n_0 V_0 k_B dT_{\parallel}}_{dU} = -p_0 dV = p_0 V_0 \frac{dn}{n_0} \quad dn \rightarrow n_1, \quad dT_{\parallel} \rightarrow T_{1\parallel}$$

$$\Rightarrow k_B T_{1\parallel} = \frac{2p_0}{n_0^2} n_1 = \frac{2k_B T_0}{n_0} n_1 \quad P_{1xx} = n_1 k_B T_0 + n_0 k_B T_{1\parallel} = 3k_B T_0 n_1$$

In longitudinal direction, electrons are particles with 1 degree of freedom ( $\gamma=3$ )

$$\frac{\partial}{\partial t} u_1 = -\frac{e}{m_e} E_1 - \frac{3k_B T}{m_e n_0} \frac{\partial n_1}{\partial x} \quad \Rightarrow \frac{\partial^2 n_1}{\partial t^2} - \frac{3k_B T_0}{m_e} \frac{\partial^2 n_1}{\partial x^2} + \frac{e^2 n_0}{\epsilon_0 m_e} n_1 = 0$$

Plasma wave propagates  $\omega^2 = \omega_p^2 + 3k^2 v_{Te}^2 \quad (v_{Te}^2 = k_B T_e / m_e)$

Dispersion relation  $\omega^2 = \omega_p^2 + 3k^2 v_{Te}^2$

$$v_\phi = \frac{\omega}{k} = \sqrt{3v_{Te}^2 + \frac{\omega_p^2}{k^2}}$$

$$v_g = \frac{d\omega}{dk} = \frac{3kv_{Te}^2}{\sqrt{\omega_p^2 + 3k^2 v_{Te}^2}}$$

$$v_g = \frac{3v_{Te}^2}{v_\phi}$$

System with temporal and spatial dispersion  $\epsilon_r^{(l)}(\omega, \vec{k}) = 1 - \frac{\omega_p^2}{\omega^2} - \frac{3k^2 v_{Te}^2}{\omega^2}$

## Description via Vlasov equation

$$\frac{\partial f_e}{\partial t} + \vec{v} \frac{\partial f_e}{\partial \vec{r}} - e\vec{E} \frac{\partial f_e}{\partial \vec{p}} = 0 \quad \text{solution } f_0(\vec{p}), \vec{E}_0 = 0$$

$$\text{Perturbations } f_1(\vec{r}, \vec{p}), \vec{E}_1, \vec{k} = \hat{x}k \quad \frac{\partial f_1}{\partial t} + v_x \frac{\partial f_1}{\partial x} - eE_1 \frac{\partial f_0}{\partial p_x} = 0$$

Solution in the form  $\exp(ikx - i\omega t)$

$$f_1 = i \frac{eE_1}{\omega - kv_x} \frac{\partial f_0}{\partial p_x} \quad \text{perturbation need not be small for } v_x = v_\phi = \omega/k$$

$\Rightarrow$  *resonance electrons*

$$\text{div } \vec{E}_1 = -\frac{e}{\epsilon_0} n_1 = -\frac{e}{\epsilon_0} \int f_1 d\vec{p}$$

$$ikE_1 = -\frac{e}{\epsilon_0} \int i \frac{eE_1}{\omega - kv_x} \frac{\partial f_0}{\partial p_x} d\vec{p}$$

$$ik\epsilon_0 \underbrace{\left( 1 + \frac{e^2}{\epsilon_0 k} \int \frac{1}{\omega - kv_x} \frac{\partial f_0}{\partial p_x} d\vec{p} \right)}_{\epsilon_r} E_1 = 0$$

$$\epsilon_r = 1 - \frac{\omega_p^2}{\omega^2} \int \frac{g(p_x)}{\left(1 - \frac{kv_x}{\omega}\right)^2} dp_x$$

where  $g(p_x) = n_0^{-1} \int f_0(\vec{p}) dp_y dp_z$

When  $v_\phi = \frac{\omega}{k} \gg v_{Te}$  we use Taylor expansion, resonance electrons are omitted  
 (for  $v_\phi > c$  there are no resonance electrons at all)

$$\epsilon_r \cong 1 - \frac{\omega_p^2}{\omega^2} \int g(p_x) \left( 1 + \frac{2kv_x}{\omega} + \frac{3k^2v_x^2}{\omega^2} \right) dp_x \quad \text{assumed } \langle v_x \rangle = u_x = 0$$

$$\text{Then } \epsilon_r = 1 - \frac{\omega_p^2}{\omega^2} - \frac{3k^2v_{Te}^2}{\omega^2} \frac{\omega_p^2}{\omega^2} \Rightarrow \omega^2 \cong \omega_p^2 + 3k^2v_{Te}^2$$

When  $v_\phi < c$  ? what to do with pole in integral – answer must be searched via solving initial value problem, i.e. perturbation is given in the initial time  $t_0$  and we follow its evolution

For solving initial value problem, Laplace transform must be applied

$$\text{Laplace transform is defined by integral } A(\omega) = \int_{t_0}^{\infty} a(t) e^{i\omega t} dt \quad \text{for } \omega \text{ with enough}$$

large positive imaginary part (for  $a(t)$  limited, it is for  $\text{Im}(\omega) > 0$ )

For other  $\omega$ , Laplace transform is obtained by analytic continuation of function

$$\epsilon_r = 1 + \frac{m_e \omega_p^2}{k} \int \frac{1}{\omega - kv_x} \frac{dg}{dp_x} dp_x$$

For  $\text{Im}(\omega) > 0$  integration path runs below the pole, when doing analytic continuation the path has to stay always below pole (go around pole from below !)

One knows from residue theorem that integral over half-circle is  $i \times \pi \times \text{residue}$

For  $\omega/k \ll c$  it is

$$\frac{1}{\omega - kv_x} = -\frac{m_e}{k} \frac{1}{p_x - \frac{m_e \omega}{k}} = -\frac{m_e}{k} \frac{\mathbf{P}}{p_x - \frac{m_e \omega}{k}} - i\pi \frac{m_e}{k} \delta\left(p_x - \frac{m_e \omega}{k}\right)$$

Here  $\mathbf{P}$  denotes integral in the sense of Cauchy principal value

For  $\omega$  real it is

$$\text{Im } \epsilon_r(\omega, k) = -\pi \omega_p^2 \frac{m_e^2}{k^2} \frac{dg}{dp_x} \Big|_{p_x = \frac{m_e \omega}{k}}$$

$\text{Im}(\epsilon_r) > 0$

$\text{Im}(\epsilon_r) < 0$

One searches complex  $\omega = \omega_R + i \omega_I$  so that  $\epsilon_r(\omega, k) = 0$

Weakly damped (slowly growing) waves  $|\omega_I| \ll \omega_R$

$$\varepsilon_r(\omega_R + i\omega_I) = \text{Re } \varepsilon_r(\omega_R) + i \text{Im } \varepsilon_r(\omega_R) + i\omega_I \frac{d \text{Re } \varepsilon_r(\omega_R)}{d\omega_R} = 0$$

For  $\omega_R/k \gg v_{Te}$  it is 
$$\text{Re } \varepsilon_r(\omega_R) = 1 - \frac{\omega_p^2}{\omega_R^2} - \frac{3k^2 v_{Te}^2}{\omega_R^2} = 0$$

and thus 
$$\omega_R^2 = \omega_p^2 + 3k^2 v_{Te}^2$$

imaginary part of frequency is

$$\omega_I = - \frac{\text{Im } \varepsilon_r(\omega_R)}{d \text{Re } \varepsilon_r(\omega_R)} = \pi \omega_p^2 \frac{m_e^2 \omega_R}{2k^2} \frac{dg}{dp_x} \Big|_{p_x = \frac{m_e \omega_R}{k}}$$

The evolution is  $\exp(-i\omega_R t) \exp(\omega_I t)$  - the rate of Landau damping is  $\gamma_L = -\omega_I$

For Maxwell's distribution it is 
$$\omega_I = - \sqrt{\frac{\pi}{8}} \frac{\omega_p^2 \omega_R^2}{k^3 v_{Te}^3} \exp\left(-\frac{\omega_R^2}{2k^2 v_{Te}^2}\right)$$

## Energy of plasma wave

$$-\epsilon_0 \frac{\partial \vec{E}}{\partial t} = \vec{j} \quad \Rightarrow \quad \frac{1}{2} \epsilon_0 \frac{\partial}{\partial t} E^2 = -\vec{j} \vec{E} \quad E = \frac{1}{2} (\tilde{E} e^{-i\omega_R t} + \tilde{E}^* e^{i\omega_R t})$$

$\tilde{E}$  is complex amplitude,  $R$  denotes real part, we average over time  $\langle \rangle_{\frac{2\pi}{\omega_R}}$

$$\frac{\epsilon_0}{4} \frac{d}{dt} |\tilde{E}|^2 = -\frac{1}{2} (\text{Re } \sigma(\omega)) |\tilde{E}|^2 \quad \text{Re } \sigma(\omega) = \text{Re } \sigma(\omega_R) - \omega_I \left. \frac{d \text{Im } \sigma}{d \omega} \right|_{\omega_R}$$

$$\frac{\epsilon_0}{4} \frac{d}{dt} |\tilde{E}|^2 - \frac{1}{4} \left. \frac{d \text{Im } \sigma}{d \omega} \right|_{\omega_R} \frac{d}{dt} |\tilde{E}|^2 = -\frac{1}{2} \text{Re } \sigma(\omega_R) |\tilde{E}|^2 \quad \text{used } \frac{d \tilde{E}}{dt} = \omega_I \tilde{E}$$

Conductivity  $\sigma$  related to permittivity  $\epsilon_r$   $\epsilon_r = 1 + \frac{i\sigma}{\omega\epsilon_0} \rightarrow \text{let } \epsilon_R = \text{Re}(\epsilon_r)$

$$\frac{d}{dt} \left[ \frac{1}{4} \left. \frac{d}{d\omega} (\omega \epsilon_0 \epsilon_R) \right|_{\omega_R} |\tilde{E}|^2 \right] = -\frac{1}{2} \text{Re } \sigma(\omega_R) |\tilde{E}|^2$$

$W_{tot} = \text{energy density}$

general expression

(plasma wave  $\frac{d}{d\omega} (\omega \epsilon_0 \epsilon_R) = 2\epsilon_0$ )

## Linear × Non-linear Landau damping

in coordinate system connected to the wave is  $\omega_R=0$

$$E_1 = \tilde{E} \sin kx \quad \text{a} \quad U_p = -e\phi = -\frac{e\tilde{E}}{k} \cos kx$$

and electron equation of motion is

$$m_e \ddot{x} = -e\tilde{E} \sin kx$$

electron oscillates in potential well with frequency

$$\omega_b = \left( \frac{e\tilde{E}k}{m_e} \right)^{1/2} \quad (\text{bounce frequency})$$

for times  $t \ll \omega_b^{-1}$  motion is not influenced by field  $\Rightarrow$  Landau damping is linear

for  $\gamma_L = -\omega_i > \omega_b$

in time  $t = \pi / \omega_b$  electrons start to return energy to wave  
trapped electrons

$$v_\phi - v_t < v < v_\phi + v_t$$

$$m_e v_t^2 / 2 = 2 |e\phi_m|$$

$$v_t = 2 \left( \frac{e\tilde{E}}{m_e k} \right)^{1/2}$$

## BGK modes (Bernstein, Green, Kruskal)

It follows from inhomogeneous equilibrium – accurate **non-linear** solution  
Stationary Vlasov equation for particle  $s$  has solution

$$v_x \frac{\partial f}{\partial x} + q_s E \frac{\partial f}{\partial p} = 0 \quad f = f \left( \frac{p^2}{2m_s} + q_s \phi(x) \right) = f(U)$$

Simplest solution for cold untrapped beams

$$n_e(x) v_e(x) = n_0 v_{e0} \quad n_i(x) v_i(x) = \frac{n_0}{Z} v_{i0} \quad v_e(x) = \sqrt{v_{e0}^2 + 2e\phi(x)/m_e}$$

Continuity equation for  $e, i$  and particle motion in potential field ( $v_i$  similarly)

Charge densities of particle are inserted into Poisson equation

$$\frac{d^2 \phi}{dx^2} = \frac{en_0}{\epsilon_0} \left( \frac{v_{e0}}{v_e(x)} - \frac{v_{i0}}{v_i(x)} \right) = \frac{en_0}{\epsilon_0} \left\{ \left( 1 + \frac{2e\phi}{m_e v_{e0}^2} \right)^{-1/2} - \left( 1 - \frac{2Ze\phi}{M_i v_{i0}^2} \right)^{-1/2} \right\}$$

Equation is similar to that for motion in potential field – potential  $V(\phi)$

$$\frac{d^2 \phi}{dx^2} = -\frac{\partial}{\partial \phi} V(\phi) \quad \text{where} \quad V(\phi) = -\frac{n_0}{\epsilon_0} \left\{ m_e v_{e0}^2 \left( 1 + \frac{2e\phi}{m_e v_{e0}^2} \right)^{1/2} + \frac{M_i v_{i0}^2}{Z} \left( 1 - \frac{2Ze\phi}{M_i v_{i0}^2} \right)^{1/2} \right\}$$

For small  $\varphi$   $|e\varphi(x)| \ll m_e v_{e0}^2 \wedge |e\varphi(x)| \ll \frac{M_i v_{i0}^2}{Z}$

$$\frac{d^2 \varphi}{dx^2} + \frac{n_0 e^2}{\epsilon_0} \left( \frac{1}{m_e v_{e0}^2} + \frac{Z}{M_i v_{i0}^2} \right) \varphi = 0$$

solution  $\varphi(x) = \varphi_0 \sin(x / \lambda_{BGK})$   
 $\lambda_{BGK}^{-2} = \omega_{pe}^2 / v_{e0}^2 + \omega_{pi}^2 / v_{i0}^2$

periodic potential  
 electrons see it reversely

For any potential, it is possible to construct such stationary distribution of ions and electrons that it creates this given potential

### Case-van Kampen modes

One searches for  $f_1$  for given  $\omega, k$   $f_1 = \tilde{f}_1 \exp(ikx - i\omega t)$  contain  $\delta$  function – non-physical

There exist combinations CvK modes that do not contain singularities

## High-frequency electrostatic waves in plasma with stationary magnetic field $B_0$

$\vec{k} \parallel \vec{B}_0$  magnetic field does not influence waves  $\Rightarrow$  plasma waves

$\vec{k} \perp \vec{B}_0$  additionally to electrostatic forces, electrons are returned back by magnetic field – cyclotron frequency  $\omega_c$

when  $T=0$   $\omega^2 = \omega_p^2 + \omega_c^2 \equiv \omega_h^2$  upper hybrid frequency

**upper hybrid waves** – plasma waves in direction normal to  $\vec{B}_0$   
in warm plasma they propagate due to thermokinetic pressure (similarly as plasma waves)

additionally there exist *linear* eigenmodes of Vlasov equation that do not have hydrodynamic equivalent – **Bernstein modes**

## Stream instabilities (Two-stream instability)

Many situations – motion electrons against ions, motion of electron groups

Simplest situation (*mainly for analytic solution*) – 2 identical electron groups against each other – ions static  $u_i=0$

$$n_{A0} = n_{B0} = n_0/2,$$

$$\sum n_i = n_0$$

$$v_{Te} \ll v_0$$

$$E_0 = 0$$

$$\frac{\partial n_\alpha}{\partial t} + \frac{\partial}{\partial x}(n_\alpha u_\alpha) = 0 \quad \frac{\partial u_\alpha}{\partial t} + (u_\alpha \nabla u_\alpha) = -\frac{eE}{m_e} \quad \text{div } E = -\frac{e}{\epsilon_0}(n_A + n_B - n_0)$$

We solve evolution of linear perturbation  $n_{\alpha 1}, u_{\alpha 1}, E_1 \sim \exp(ikx - i\omega t)$

$$-i\omega n_{A1} + ik(n_0 u_{A1} / 2 - v_0 n_{A1}) = 0 \quad -i\omega n_{B1} + ik(n_0 u_{B1} / 2 + v_0 n_{B1}) = 0$$

$$-i\omega u_{A1} - ikv_0 u_{A1} = -\frac{eE_1}{m_e} \quad -i\omega u_{B1} + ikv_0 u_{B1} = -\frac{eE_1}{m_e} \quad ikE_1 = -\frac{e}{\epsilon_0}(n_{A1} + n_{B1})$$

Amplitudes of velocities are expressed from equations of motion and we substitute them into continuity equations

$$n_{A1} = k \frac{n_0}{2} (-i) \frac{eE_1}{m_e (\omega + kv_0)^2} \quad n_{B1} = k \frac{n_0}{2} (-i) \frac{eE_1}{m_e (\omega - kv_0)^2} \quad \text{and insert them to}$$

Poisson equation  $ikE_1 = ik \frac{e^2 n_0}{2\epsilon_0 m_e} \left( \frac{1}{(\omega + kv_0)^2} + \frac{1}{(\omega - kv_0)^2} \right) E_1$  and from here

we obtain dispersion relation  $1 = \frac{\omega_p^2}{2} \left( \frac{1}{(\omega + kv_0)^2} + \frac{1}{(\omega - kv_0)^2} \right)$  leading to

$$\omega^4 - (2k^2 v_0^2 + \omega_p^2) \omega^2 + k^2 v_0^2 (k^2 v_0^2 - \omega_p^2) = 0, \text{ character of the}$$

solution depends on the sign of absolute term, if it is  $> 0$ ,  $\omega_1^2 > 0$ ,  $\omega_2^2 > 0$

then system is stable, if  $k^2 v_0^2 < \omega_p^2$ , then  $\omega_1^2 > 0$ ,  $\omega_2^2 < 0$  and root with

positive imaginary frequency exists – solution grows in time – **instability**

$$\omega_{1,2}^2 = k^2 v_0^2 + \frac{\omega_p^2}{2} \left( 1 \pm \sqrt{1 + 8 \frac{k^2 v_0^2}{\omega_p^2}} \right), \text{ pro } k^2 v_0^2 < \omega_p^2 \text{ je } \omega_{3,4} = \pm i \sqrt{-\omega_2^2}$$

and solution  $\omega_3 = i \sqrt{-\omega_2^2}$  is growing  $\exp(-i\omega_3 t) = \exp(\gamma t)$

for  $k^2 v_0^2 \ll \omega_p^2$  it is  $\omega_3 = i\gamma = i|k|v_0$  search for fastest growing mode ( $k$ ),—

in maximum 
$$\frac{d(-\omega_2^2)}{d(k^2 v_0^2)} = 0 \Rightarrow k^2 v_0^2 = \frac{3}{8} \omega_p^2; \quad \gamma = \frac{\omega_p}{\sqrt{8}}$$

thus fastest growing mode grows only a bit slower than  $\omega_p$

How the growing modes look like?

Pro small  $k$  for growing mode  $\omega = i|k|v_0$   
 density perturbations of A,B nearly cancel  
 (upper figure –  $v_0=2$ ) Field  $E_1$  is formed only by small sum of densities of order  $\sim k^2 v_0^2 / \omega_p^2$   
 growing field  $\exp(ikx + kv_0 t)$

Fastest growing mode (lower figure)

One sees nonzero sum of density perturbations of beams A,B

Here special case of growing static perturbation (due to problem symmetry)

Other case – electron motion against ions with velocity  $v_0$

We introduce  $x = \omega/\omega_p$  and  $y = kv_0/\omega_p$

Dispersion relation 
$$1 = \frac{m_e / M_i}{x^2} + \frac{1}{(x - y)^2} = F(x, y)$$

for  $y >$  boundary, the dispersion relation has 4 real roots – stable system  
 for  $y <$  boundary, the dispersion relation has only 2 real roots – instability

stability boundary 
$$y^2 = \left(1 + \sqrt[3]{\frac{M_i}{m_e}}\right)^2 \left(\frac{m_e}{M_i}\right)^{2/3} \left(1 + \sqrt[3]{\frac{m_e}{M_i}}\right) \approx 1 \quad (\text{thus } kv_0 \approx \omega_p)$$

maximal growth 
$$\gamma_{\max} = \omega_p \left(\frac{m_e}{M_i}\right)^{1/3}$$
